

Fast start. Strong finish.

Never re-implant heifers again.

Revalor®-XH (trenbolone acetate and estradiol) is the one-time, long-acting implant for heifers that starts working immediately, while providing a strong finish. With Revalor-XH, you can count on improved performance, consistent feed intake and reduced stress associated with re-implantation.

No more re-implants. Each Revalor-XH implant is two implants in one: four uncoated pellets (first dose) go to work immediately like an initial implant while six coated pellets (second dose) release slowly as a re-implant, without having to re-implant.

REVALOR-XH

The most consistent all-around implant for heifers

PROVEN PERFORMANCE

From start to finish, Revalor-XH is the most consistent all-around implant for heifers on the market today. Its timed release of active ingredients from coated pellets provides you with the carcass quality you need with feedyard growth performance you can rely on.

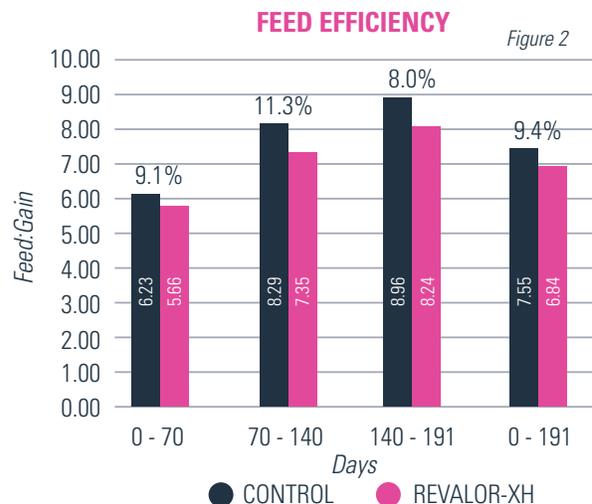

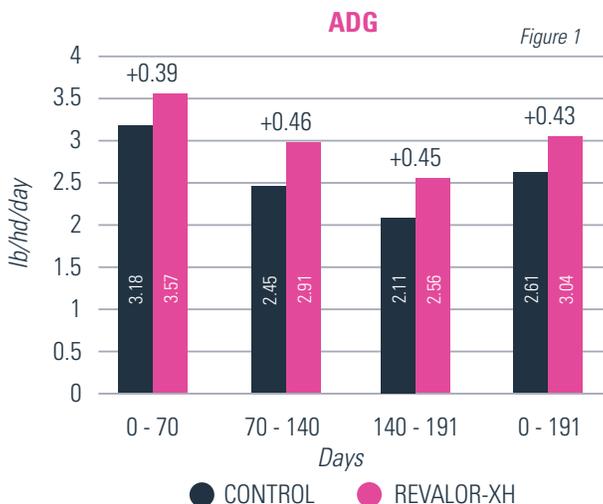

Every time your crew re-implants, it impacts time, labor and resources that could be used somewhere else. By taking that second implant off your schedule, you'll benefit from uninterrupted feeding and more consistent growth.

CONSISTENT RESULTS

Take a look at these results. From day 1, average daily gain (ADG) was improved by 0.39 lb/day or 12.3% while feed efficiency was improved by 0.57 units or 9% during first 70 days of FDA efficacy studies (Figure 1). Revalor-XH makes sure your heifers get off to a fast start.

And growth stays consistent for the entire finishing period. In FDA approval studies, there was 0.39 to 0.46 lb/day improvement in ADG during each 51-70-day interim period and 9.4-11% improvement in feed efficiency during each 51-70 day interim period (Figure 2).

The results clearly demonstrate how Revalor-XH consistently delivers results in the key areas that directly affect your bottom line — ADG, feed efficiency.

NEVER RE-IMPLANT HEIFERS AGAIN

SIMILAR LIVE AND CARCASS PERFORMANCE TO CURRENT RE-IMPLANT PROGRAMS.

Studies conducted in Nebraska and Texas demonstrated similar live and carcass performance between Revalor-XH and re-implant of Revalor-200/ Revalor-200 or Revalor-IH/Revalor-200, respectively. The studies detected no differences in final live weight, ADG and hot carcass weight.

LONG-LASTING PERFORMANCE WITH JUST ONE TRIP THROUGH THE CHUTE.

- Improved weight gain and feed efficiency over the entire finishing period.
- Performance and economic benefits start on the day of implantation.
- Heifers can remain in their home pen with no need for disruptions caused by re-implanting.
- Performance and economic returns from one Revalor-XH implant are similar to those obtained from current re-implant programs.

With Revalor-XH, you can be confident knowing that you're getting it right the first time, every time. The results speak for themselves — improved average daily gain and feed efficiency. And you can do it all without the added stress and expense of re-implanting.

GIVE YOUR HEIFERS THE REVALOR TREATMENT.

Revalor-XH
(trenbolone acetate and estradiol)

A withdrawal period has not been established for Revalor in pre-ruminating calves. Do not use in calves to be processed for veal. For complete information, refer to product label.
